Advantages and Disadvantages of Linked List

[Ads by Google](#)[Programming in C](#)[Learn Java Programming](#)

Here you will learn about advantages and disadvantages of [linked list](#).

It is a data structure in which elements are linked using pointers. A node represents an element in linked list which have some data and a pointer pointing to next node. Its structure looks like as shown in below image.

There are various merits and demerits of linked list that I have shared below.

Advantages and Disadvantages of Linked List

Advantages of Linked List

Dynamic Data Structure

Linked list is a dynamic data structure as it can grow and shrink at runtime by allocating and deallocating memory. So there is no need to give initial size of linked list.

Insertion and Deletion

Insertion and deletion of nodes are really easier. Unlike array here we don't have to shift elements after insertion or deletion of an element. In linked list we just have to update the address present in next pointer of a node.

No Memory Wastage

As size of linked list can increase or decrease at run time so there is no memory wastage. In case of array there is lot of memory wastage, like if we declare an array of size 10 and store only 6 elements in it then space of 4 elements are wasted. There is no such problem in linked list as memory is allocated only when required.

Implementation

Data structures such as stack and queues can be easily implemented using linked list.

Disadvantages of Linked List

Memory Usage

More memory is required to store elements in linked list as compared to array. Because in linked list each node contains a pointer and it requires extra memory for itself

Traversal

Elements or nodes traversal is difficult in linked list. We can not randomly access any element as we do in array by index. For example if we want to access a node at position n then we have to traverse all the nodes before it. So time required to access a node is large.

Reverse Traversing

In linked list reverse traversing is really difficult. In case of doubly linked list its easier but extra memory is required for back pointer hence wastage of memory.

If you know some other advantages and disadvantages of linked list then please mention by commenting below.
